

AZACYCLIC COMPOUNDS AS INHIBITORS  
OF SENSORY NEURONE SPECIFIC CHANNELS

The present invention relates to inhibitors of the subtype of mammalian sodium channels known as Na<sub>v</sub>1.8 or sensory neurone specific (SNS) channels. The Na<sub>v</sub>1.8 channel is a 1,957 amino acid tetrodotoxin-insensitive voltage-gated sodium channel. The sodium channel, nucleic acid sequences coding for the channel, vectors, host cells and methods of identifying modulators, are taught in US-A-6451554. The  $\alpha$ -subunit gene corresponding to this ion channel is referred to as SCN10A. The channel is described in more detail in Akopian *et al.*, (1996), 379, 257-262.

Mammalian ion channels are becoming increasingly well characterized, and progress in sodium channel research has been summarized recently in Anger *et al*, J. Med. Chem. (2001) 44, 115-137. Sodium channels are recognised as valid targets for pain therapeutics, and blockade of sodium channels can be useful in the treatment of a range of pain syndromes (see for example Black *et al*, Progress in Pain Research and Management (2001), 21(Neuropathic Pain: Pathophysiology and Treatment), 19-36).

It has now surprisingly been found that compounds of the general formula (I) set out below act as inhibitors of sensory neurone specific sodium channels. Accordingly, the present invention provides a compound of the formula (I), or a pharmaceutically acceptable salt thereof,

- and pharmaceutically acceptable salts thereof.

As used herein, a pharmaceutically acceptable salt is a salt with a pharmaceutically acceptable acid or base. Pharmaceutically acceptable acids include both inorganic acids such as hydrochloric, sulphuric, phosphoric, diphosphoric, hydrobromic or nitric acid and organic acids such as citric, fumaric, maleic, malic, ascorbic, succinic, tartaric, benzoic, acetic, methanesulfonic, ethanesulfonic, benzenesulfonic or p-toluenesulfonic acid. Pharmaceutically acceptable bases include alkali metal (e.g. sodium or potassium) and alkali earth metal (e.g. calcium or magnesium) hydroxides and organic bases such as alkyl amines, aralkyl amines or heterocyclic amines.

The compounds of the invention can contain one or more chiral centres. For the avoidance of doubt, the chemical structures depicted herein are intended to embrace all stereoisomers of the compounds shown, including racemic and non-racemic mixtures and pure enantiomers and/or diastereoisomers.

Preferred compounds of the invention are optically active isomers. Thus, for example, preferred compounds of formula (I) containing only one chiral centre include an R enantiomer in substantially pure form, an S enantiomer in substantially pure form and enantiomeric mixtures which contain an excess of the R enantiomer or an excess of the S enantiomer.

The compounds of formula (I) may be prepared by conventional routes, for example those set out in any of schemes 1 to 10 shown below.

Compounds of formula (1) in which m is 2 and X, R<sub>1</sub>, n and R<sub>2</sub> are defined as above (reaction scheme 1) may be prepared from compounds of formula (2) and compounds of formula (3) where X is a leaving group, typically chlorine, using

standard methods such as reaction in the presence of a base, for example potassium carbonate. Typically the reaction is performed in a solvent such as methanol, tetrahydrofuran or acetonitrile at a temperature of 95°C. Compounds of formula (2) may be prepared from compounds of formula (4) by standard methods familiar to those skilled in the art such as reduction in the presence of platinum oxide.

Alternatively, compounds of formula (2) may be prepared from compounds of formula (5) and formaldehyde by standard methods such as the Pictet-Spengler cyclisation.

Compounds of formula (4) are known compounds or may be prepared by standard methods such as cyclisation of compounds of formula (6) according to the published procedure (Bioorg. Med. Chem. 7 (1999) 2647-2666).

Scheme 1

Compounds of formula (1) in which m is 1 and X,  $R_1$ , n and  $R_2$  are defined as above (reaction scheme 2) may be prepared from compounds of formula (2) and compounds of formula (3) where X is a leaving group, typically chlorine, using standard methods such as reaction in the presence of a base for example potassium carbonate. Typically the reaction is performed in a solvent such as methanol, tetrahydrofuran or acetonitrile at a temperature of 95°C.

Compounds of formula (2) may be prepared from compounds of formula (7) where X is a leaving group, preferably bromine, by standard methods familiar to

25

those skilled in the art such as alkylation in the presence of an amine. Alternatively, compounds of formula (2) can be prepared from compounds of formula (7) where X is OH converted into a better leaving group such as a mesylate under standard alkylating conditions familiar to those skilled in the art. Compounds of formula (7) may be prepared from dimethylaryl compounds (8) by bromination using a brominating reagent, for example N-bromosuccinimide. Alcohols (9) may be prepared from acids (10) by standard methods such as reduction in the presence of lithium aluminium hydride.

## 10 Scheme 2

Compounds of formula (1) in which m is 3 and X, R<sub>1</sub>, n and R<sub>2</sub> are defined as above (reaction scheme 3) may be prepared from compounds of formula (2) and compounds of formula (3) where X is a leaving group, typically chlorine, using standard methods such as reaction in the presence of a base for example potassium carbonate. Typically the reaction is performed in a solvent such as methanol, tetrahydrofuran or acetonitrile at a temperature of 95°C.

Compounds of formula (2) where m is 3 may be prepared from compounds of formula (11) by reduction in the presence of a metal hydride for example lithium aluminium hydride. Compounds of formula (11) may be prepared from tetralones (12) by standard methods familiar to those skilled in the art such as the Schmidt reaction. Alternatively, compounds of formula (11) may be prepared from tetralones

(12) by standard methods familiar to those skilled in the art such as the Beckmann rearrangement or further methods as outlined e.g. in Alicyclic Chemistry, (Martin Grossel, Oxford University Press). Tetralones (12) are either known compounds or can be prepared by analogy with known methods.

### Scheme 3

When  $R_2$  is  $-L-A$  and  $L$  is other than a direct bond, or when  $R_2$  is  $-L-CR(A)_2$ , the reaction between the compounds of formulae (2) and (3) in schemes 1, 2 and 3 is typically performed in a solvent such as methanol, tetrahydrofuran or acetonitrile at a temperature of  $80^\circ\text{C}$ . When  $R_2$  is  $-L-A$  and  $L$  is a direct bond, the reaction between the compounds of formulae (2) and (3) is typically effected by Buchwald coupling. Thus,  $X$  in the formula (3) is typically bromine or iodine.

The compounds of formula (3) are known compounds, or may be prepared by known methods. For example, compounds of formula (3) in which R<sub>2</sub> is -(CH<sub>2</sub>)<sub>2</sub>-CH(A)<sub>2</sub> can be prepared by the reduction of compounds of formula (14) in the presence of a reducing agent such as lithium aluminium hydride followed by halogenation in the presence of a halogenating agent such as PBr<sub>3</sub> (reaction scheme 4). Compounds of formula (14) may be prepared from diarylethenylacids (15) by reduction in the presence of a reducing agent such as palladium. Diarylethenylacids may be prepared from ketones (16) by standard methods familiar to those skilled in the art such as Wittig reaction.

Scheme 4

5        Compounds of formula (3) in which  $R_2$  is  $-L-CH=C(A)_2$  where L and A are defined as above (reaction scheme 5) may be prepared from corresponding carboxylic acids by reduction in the presence of a reducing agent, for example lithium aluminium hydride, followed by halogenation in the presence of a halogenating reagent for example  $PBr_3$ .

10

Scheme 5

15        Compounds of formula (3) wherein  $R_2$  is  $-L'-Het-A'$  can, for example, be prepared from compounds of formula (19) where Y is a leaving group, by reaction with compounds of formula (20) (reaction scheme 6). Compounds of formula (18) in which  $A'$  is  $-CH_2(A)_2$  may also be prepared from compounds of formula (16) and compounds of formula (20) by standard methods familiar to those skilled in the art.

20        Thus, when Het is O or S, compounds (16) and (20) can be condensed in the presence of an acid catalyst, for example PTSA. When Het is NH the reaction between compounds (16) and (20) can be effected by standard methods such as reductive amination in the presence of a reducing agent, for example sodium borohydride.

Scheme 6

5

When  $R_2$  is  $-\text{L-CO-NR}_3\text{R}_4$  the reaction between the compounds of formulae (2) and (3) in schemes 1 to 3 is typically effected in the presence of a base for example triethylamine. Typically the reaction is performed in a solvent such as methanol, tetrahydrofuran or acetonitrile at a temperature of  $80^\circ\text{C}$ . Further, compounds of formula (1) wherein  $R_2$  is  $-\text{L-CS-NR}_3\text{R}_4$  may be prepared from compounds of formula (1) where  $R_2$  is  $-\text{L-CO-NR}_3\text{R}_4$  by standard methods familiar to those skilled in the art such as sulphonation in the presence of Lawesson's reagent.

10

Compounds of formula (3) in which  $R_2$  is  $-\text{L-CO-NR}_3\text{R}_4$  can be prepared from amines (22) and compounds of formula (23), in which  $X'$  is Cl or OH, under standard amide coupling reaction conditions (reaction scheme 7). Typically, where  $X'$  is Cl, the reaction is effected in the presence of triethylamine.

15

Scheme 7

20

A further method for preparing compounds of formula (1) wherein X, m, R<sub>1</sub> and n are defined as above and R<sub>2</sub> is -CO-L-NR<sub>3</sub>R<sub>4</sub> involves the reaction of amides (24) and amines (22) where X is a leaving group, preferably chlorine, using standard methods such as reaction in the presence of a base for example triethylamine (reaction scheme 8). Typically the reaction is performed in a solvent such as methanol, tetrahydrofuran or acetonitrile at a temperature of 80°C. Amides (24) may be prepared from amines (2) and acids (23), wherein X' is Cl or OH, under standard amide coupling reaction conditions. Typically, where X' is Cl, the reaction is effected in the presence of triethylamine.

Alternatively, compounds of formula (1) where R<sub>2</sub> is -CO-L-NR<sub>3</sub>R<sub>4</sub>, L is a direct bond and R<sub>4</sub> is hydrogen may be prepared from amines (2) by standard methods familiar to those skilled in the art such as alkylation with isocyanates (25). Similarly, compounds of formula (1) where R<sub>2</sub> is -CS-L-NR<sub>3</sub>R<sub>4</sub> and L is a direct bond may be prepared from amines (2) by standard methods such as alkylation with isothiocyanates (26). Compounds of formula (1) wherein R<sub>2</sub> is -CS-L-NR<sub>3</sub>R<sub>4</sub> can, of course, be prepared from compounds of formula (1) where R<sub>2</sub> is -L-CO-NR<sub>3</sub>R<sub>4</sub> by standard methods familiar to those skilled in the art such as sulphonation using Lawesson's reagent.

## Scheme 8

When  $R_2$  is  $-\text{CO}-\text{A}'$ , the reaction between the compounds of formulae (2) and (3) in schemes 1, 2 and 3 is typically effected in the presence of a coupling agent such as EDC/HOBT, HATU or HBTU. Compounds of formula (1) wherein  $R_2$  is  $-\text{CS}-\text{A}'$  can, of course, be prepared from compounds of formula (1) where  $R_2$  is  $-\text{CO}-\text{A}'$  by standard methods familiar to those skilled in the art such as reaction with Lawesson's reagent.

Compounds of formula (3), wherein  $R_2$  is  $-\text{CO}-\text{L}'-\text{O}-\text{N}=\text{C}(\text{A})_2$  or  $-\text{L}'-\text{O}-\text{N}=\text{C}(\text{A})_2$  may be prepared from ketones (16) and hydroxylamine by standard methods familiar to those skilled in the art (reaction scheme 9). In reaction scheme 9, X and X' represent leaving groups, for example chlorine.

Further, an additional method of preparing compounds of formula (I) in which  $R_2$  is  $-\text{CO}-\text{L}'-\text{O}-\text{N}=\text{C}(\text{A})_2$  or  $-\text{L}'-\text{O}-\text{N}=\text{C}(\text{A})_2$  involves the reaction of a compound of formula (31) or (31a), wherein X is a leaving group, typically chlorine, and oximes (29) by standard methods as previously described. Compounds of formulae (31) and (31a) may be prepared from amines (2) and compounds of formulae (30) or (30a) under standard amide coupling conditions as previously described.

Scheme 9

The compounds of the invention are found to be inhibitors of sensory neurone specific sodium channels. The compounds of the invention are therefore therapeutically useful. Accordingly, the present invention provides a compound of the formula (I), as defined above, or a pharmaceutically acceptable salt thereof, for use in the treatment of the human or animal body. Also provided is a pharmaceutical composition comprising a compound of the formula (I), as defined above, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier or diluent. Said pharmaceutical composition typically contains up to 85 wt% of a compound of the invention. More typically, it contains up to 50 wt% of a compound of the invention. Preferred pharmaceutical compositions are sterile and pyrogen free. Further, the pharmaceutical compositions provided by the invention typically contain a compound of the invention which is a substantially pure optical isomer.

The compounds of the invention may be administered in a variety of dosage forms. Thus, they can be administered orally, for example as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules. Preferred pharmaceutical compositions of the invention are compositions suitable for oral administration, for example tablets and capsules.

Compositions suitable for oral administration may, if required, contain a colouring or flavoring agent. Typically, a said capsule or tablet comprises from 5 to 500 mg, preferably 10 to 500 mg, more preferably 15 to 100 mg, of a compound of formula (I) or a pharmaceutically acceptable salt thereof.

The compounds of the invention may also be administered parenterally, whether subcutaneously, intravenously, intramuscularly, intrasternally, transdermally or by infusion techniques. The compounds may also be administered as suppositories.

One preferred route of administration is inhalation. The major advantages of inhaled medications are their direct delivery to the area of rich blood supply in comparison to many medications taken by oral route. Thus, the absorption is very rapid as the alveoli have an enormous surface area and rich blood supply and first pass metabolism is bypassed.

Preferred pharmaceutical compositions of the invention therefore include those suitable for inhalation. The present invention also provides an inhalation device containing such a pharmaceutical composition. Typically said device is a

metered dose inhaler (MDI), which contains a pharmaceutically acceptable chemical propellant to push the medication out of the inhaler. Typically, said propellant is a fluorocarbon.

Further preferred inhalation devices include nebulizers. Nebulizers are  
5 devices capable of delivering fine liquid mists of medication through a "mask" that fits over the nose and mouth, using air or oxygen under pressure. They are frequently used to treat those with asthma who cannot use an inhaler, including infants, young children and acutely ill patients of all ages.

Said inhalation device can also be, for example, a rotary inhaler or a dry  
10 powder inhaler, capable of delivering a compound of the invention without a propellant.

Typically, said inhalation device contains a spacer. A spacer is a device which enables individuals to inhale a greater amount of medication directly into the lower airways, where it is intended to go, rather than into the throat. Many spacers  
15 fit on the end of an inhaler; for some, the canister of medication fits into the device. Spacers with withholding chambers and one-way valves prevent medication from escaping into the air. Many people, especially young children and the elderly, may have difficulties coordinating their inhalation with the action necessary to trigger a puff from a metered dose inhaler. For these patients, use of a spacer is particularly  
20 recommended.

Another preferred route of administration is intranasal administration. The nasal cavity's highly permeable tissue is very receptive to medication and absorbs it quickly and efficiently, more so than drugs in tablet form. Nasal drug delivery is less painful and invasive than injections, generating less anxiety among patients. Drugs  
25 can be delivered nasally in smaller doses than medication delivered in tablet form. By this method absorption is very rapid and first pass metabolism is bypassed, thus reducing inter-patient variability. Nasal delivery devices further allow medication to be administered in precise, metered doses. Thus, the pharmaceutical compositions of the invention are typically suitable for intranasal administration. Further, the present  
30 invention also provides an intranasal device containing such a pharmaceutical composition.

A further preferred route of administration is transdermal administration. The present invention therefore also provides a transdermal patch containing a compound

of the invention, or a pharmaceutically acceptable salt thereof. Also preferred is sublingual administration. The present invention therefore also provides a sublingual tablet comprising a compound of the invention or a pharmaceutically acceptable salt thereof.

5           A compound of the invention is typically formulated for administration with a pharmaceutically acceptable carrier or diluent. For example, solid oral forms may contain, together with the active compound, diluents, e.g. lactose, dextrose, saccharose, cellulose, corn starch or potato starch; lubricants, e.g. silica, talc, stearic acid, magnesium or calcium stearate, and/or polyethylene glycols; binding agents; e.g. starches, arabic gums, gelatin, methylcellulose, carboxymethylcellulose or polyvinyl pyrrolidone; disaggregating agents, e.g. starch, alginic acid, alginates or sodium starch glycolate; effervescing mixtures; dyestuffs; sweeteners; wetting agents, such as lecithin, polysorbates, laurylsulphates; and, in general, non toxic and pharmacologically inactive substances used in pharmaceutical formulations. Such pharmaceutical preparations may be manufactured in known 15 manner, for example, by means of mixing, granulating, tableting, sugar coating, or film coating processes.

Liquid dispersions for oral administration may be syrups, emulsions and suspensions. The syrups may contain as carriers, for example, saccharose or 20 saccharose with glycerine and/or mannitol and/or sorbitol.

Suspensions and emulsions may contain as carrier, for example a natural gum, agar, sodium alginate, pectin, methylcellulose, carboxymethylcellulose, or polyvinyl alcohol. The suspension or solutions for intramuscular injections may contain, together with the active compound, a pharmaceutically acceptable carrier, 25 e.g. sterile water, olive oil, ethyl oleate, glycols, e.g. propylene glycol, and if desired, a suitable amount of lidocaine hydrochloride.

Solutions for injection or infusion may contain as carrier, for example, sterile water or preferably they may be in the form of sterile, aqueous, isotonic saline solutions.

30           The compounds of the present invention are therapeutically useful in the treatment or prophylaxis of conditions involving sodium ion flux through a sensory neurone specific (SNS) channel of a sensory neurone. Said condition may be one of hypersensitivity for example resulting from a concentration of SNS channels at the

site of nerve injury or in axons following nerve injury, or may be sensitisation of the neurone for example at sites of inflammation as a result of inflammatory mediators.

Said compounds of the invention are therefore most preferred for their use in the treatment or prophylaxis of any condition involving hypersensitivity or  
5 sensitisation of a sensory neurone specific (SNS) channel of a sensory neurone.

Accordingly, the present invention also provides the use of a compound of the formula (I), or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for use in the treatment or prophylaxis of a condition involving sodium ion flux through a sensory neurone specific (SNS) channel of a sensory neurone,  
10 more specifically hypersensitivity of a sensory neurone or sensitisation of a sensory neurone specific (SNS) channel of a sensory neurone. Also provided is a method of treating a patient suffering from or susceptible to a condition involving sodium ion flux through a sensory neurone specific (SNS) channel of a sensory neurone, more specifically hypersensitivity of a sensory neurone or sensitisation of a sensory  
15 neurone specific (SNS) channel of a sensory neurone, which method comprises administering to said patient an effective amount of a compound of formula (I), or a pharmaceutically acceptable salt thereof.

The term treatment in this context is deemed to cover any effect from a cure of said condition to alleviation of any or all of the symptoms. The compounds of the  
20 invention may, where appropriate, be used prophylactically to reduce the incidence or severity of said conditions.

Specific conditions in which SNS channels are present and believed to be involved include pain, for example chronic and acute pain, hypersensitivity disorders such as bladder dysfunction and bowel disorders which may or may not also have  
25 associated pain, and demyelinating diseases.

SNS sodium channels are known to mediate pain transmission. Typically, the compounds of the invention are therefore used as analgesic agents. SNS specific sodium channels have been identified as being particularly important in the transmission of pain signals. The compounds of the invention are accordingly  
30 particularly effective in alleviating pain. Typically, therefore, said medicament is for use in alleviating pain and said patient is suffering from or susceptible to pain. The compounds of the invention are effective in alleviating both chronic and acute pain.

Acute pain is generally understood to be a constellation of unpleasant sensory, perceptual and emotional experiences of certain associated autonomic (reflex) responses, and of psychological and behavioural reactions provoked by injury or disease. A discussion of acute pain can be found at Halpern (1984) *Advances in Pain Research and Therapy*, Vol.7, p.147. Tissue injury provokes a series of noxious stimuli which are transduced by nociceptors to impulses transmitted to the spinal cord and then to the upper part of the nervous system. Examples of acute pains which can be alleviated with the compounds of the invention include musculoskeletal pain, for example joint pain, lower back pain and neck pain, dental pain, post-operative pain, obstetric pain, for example labour pain, acute headache, neuralgia, myalgia, and visceral pain.

Chronic pain is generally understood to be pain that persists beyond the usual course of an acute disease or beyond a reasonable time for an injury to heal. A discussion of chronic pain can be found in the Halpern reference given above. Chronic pain is sometimes a result of persistent dysfunction of the nociceptive pain system. Examples of chronic pains which can be alleviated with the compounds of the invention include trigeminal neuralgia, post-herpetic neuralgia (a form of chronic pain accompanied by skin changes in a dermatomal distribution following damage by acute Herpes Zoster disease), diabetic neuropathy, causalgia, "phantom limb" pain, pain associated with osteoarthritis, pain associated with rheumatoid arthritis, pain associated with cancer, pain associated with HIV, neuropathic pain, migraine and other conditions associated with chronic cephalic pain, primary and secondary hyperalgesia, inflammatory pain, nociceptive pain, tabes dorsalis, spinal cord injury pain, central pain, post-herpetic pain, noncardiac chest pain, irritable bowel syndrome and pain associated with bowel disorders and dyspepsia.

Some of the chronic pains set out above, for example, trigeminal neuralgia, diabetic neuropathic pain, causalgia, phantom limb pain and central post-stroke pain, have also been classified as neurogenic pain. One non-limiting definition of neurogenic pain is pain caused by dysfunction of the peripheral or central nervous system in the absence of nociceptor stimulation by trauma or disease. The compounds of the invention can, of course, be used to alleviate or reduce the incidence of neurogenic pain.

Examples of bowel disorders which can be treated or prevented with the compounds of the invention include inflammatory bowel syndrome and inflammatory bowel disease, for example Crohn's disease and ulcerative colitis.

Examples of bladder dysfunctions which can be treated or prevented with the compounds of the invention include bladder hyper reflexia and bladder inflammation, for example interstitial cystitis, overactive (or unstable) bladder (OAB), more specifically urinary incontinence, urgency, frequency, urge incontinence and nocturia. The compounds of the invention can also be used to alleviate pain associated with bladder hyper reflexia or bladder inflammation.

Examples of demyelinating diseases which can be treated or prevented with the compounds of the invention are those in which SNS channels are known to be expressed by the demyelinated neurones and which may or may not also have associated pain. A specific example of such a demyelinating disease is multiple sclerosis. The compounds of the invention can also be used to alleviate pain associated with demyelinating diseases such as multiple sclerosis.

The compounds of the invention have additional properties as they are capable of inhibiting voltage dependent sodium channels. They can therefore be used, for example, to protect cells against damage or disorders which results from overstimulation of sodium channels.

The compounds of the invention are useful in the treatment and prevention of peripheral and central nervous system disorders. They can therefore additionally be used in the treatment or prevention of an affective disorder, an anxiety disorder, a behavioural disorder, a cardiovascular disorder, a central or peripheral nervous system degenerative disorder, a central nervous system injury, a cerebral ischaemia, a chemical injury or substance abuse disorder, a cognitive disorder, an eating disorder, an eye disease, Parkinson's disease or a seizure disorder.

compulsive disorder (OCD).

Examples of behavioural disorders which can be treated or prevented with the compounds of the invention include behavioural and psychological signs and symptoms of dementia, age-related behavioural disorders, pervasive development disorders such as autism, Asperger's Syndrome, Retts syndrome and disintegrative disorder, attention deficit disorder, aggressivity, impulse control disorders and personality disorder.

Examples of central nervous system injuries which can be treated with the compounds of the invention include traumatic brain injury, neurosurgery (surgical trauma), neuroprotection for head injuries, raised intracranial pressure, cerebral oedema, hydrocephalus and spinal cord injury.

Examples of cerebral ischaemias which can be treated or prevented with the compounds of the invention include transient ischaemic attack, stroke, for example thrombotic stroke, ischaemic stroke, embolic stroke, haemorrhagic stroke or lacunar stroke, subarachnoid haemorrhage, cerebral vasospasm, peri-natal asphyxia, drowning, cardiac arrest and subdural haematoma.

Examples of chemical injuries and substance abuse disorders which can be treated or prevented with the compounds of the invention include drug dependence, for example opiate dependence, benzodiazepine addition, amphetamine addiction

and cocaine addiction, alcohol dependence, methanol toxicity, carbon monoxide poisoning and butane inhalation.

5 dementia, multi-infarct dementia, AIDS dementia, dementia associated with Huntingtons Disease, Lewy body Dementia, Senile dementia, age-related memory impairment, cognitive impairment associated with dementia, Korsakoff syndrome and dementia pugilans.

10 compounds of the invention include anorexia nervosa, bulimia, Prader-Willi syndrome and obesity.

25 epilepsy (simple partial seizures, complex partial seizures, and partial seizures secondarily generalised seizures), generalised seizures, including generalised tonicclonic seizures (grand mal), absence seizures (petit mal), myoclonic seizures,  
30 atonic seizures, clonic seizures, and tonic seizures, Lennox Gastaut, West Syndrome (infantile spasms), multiresistant seizures and seizure prophylaxis (antiepileptogenic).

The compounds of the present invention are also useful in the treatment and prevention of tinnitus.

A therapeutically effective amount of a compound of the invention is administered to a patient. A typical dose is from about 0.001 to 50 mg per kg of  
5 body weight, for example 0.01 to 10 mg, according to the activity of the specific compound, the age, weight and conditions of the subject to be treated, the type and severity of the disease and the frequency and route of administration. Preferably, daily dosage levels are from 5 mg to 2 g.

The following Examples illustrate the invention. They do not, however, limit the  
10 invention in any way. In this regard, it is important to understand that the particular assays used in the Examples section are designed only to provide an indication of activity in inhibiting SNS specific sodium channels. A negative result in any one particular assay is not determinative.

#### **Inhibition of Human $\text{Na}_v1.8$ stably expressed in SH-SY-5Y cells**

5        A SH-SY-5Y neuroblastoma cell line stably expressing the human  $\text{Na}_v1.8$  ( $\text{hNa}_v1.8$ ) ion channel was constructed. This cell line has been used to develop a medium to high throughput assay for determining the ability of test compounds to inhibit membrane depolarisation mediated via the  $\text{hNa}_v1.8$  channel.

SH-SY-5Y  $\text{hNa}_v1.8$  are grown in adherent monolayer culture using 50:50  
10    Ham's F-12 / EMEM tissue culture medium supplemented with 15% (v/v) foetal bovine serum; 2mM L-glutamine, 1% NEAA and  $600\mu\text{g}\cdot\text{ml}^{-1}$  Geneticin sulphate. Cells are removed from the tissue culture flask using trypsin/EDTA and re-plated into black walled, clear bottom 96-well assay plates at  $50,000\text{cells}\cdot\text{well}^{-1}$  24 hours prior to assay.

15        On the day of assay the cell assay plates are washed to remove cell culture medium using a sodium free assay buffer (145mM tetramethyl ammonium chloride; 2mM calcium chloride; 0.8mM magnesium chloride hexahydrate; 10mM HEPES; 10mM glucose; 5mM potassium chloride, pH 7.4). Fluorescent membrane potential dye solution (FLIPR™ membrane potential dye, Molecular Devices Corporation),  
20    containing  $10\mu\text{M}$  of a pyrethroid to prevent channel inactivation and 250nM tetrodotoxin (TTX) to reduce interference from TTX-sensitive sodium channels present in the cell line. Test compound, initially dissolved in dimethyl sulfoxide but further diluted in sodium free buffer, is added to achieve the final test concentration range of  $100\mu\text{M} - 0.05\mu\text{M}$ .

25        Cell plates are incubated for 30 minutes at room temperature to allow equilibration of dye and test compound. Plates are then transferred to a fluorescence plate reader for fluorescence measurement using an excitation wavelength of 530nm whilst measuring fluorescence emission at 565nm. Baseline fluorescence levels are first determined before the addition of a sodium containing buffer (220mM sodium  
30    chloride; 2mM calcium chloride; 0.8mM magnesium chloride hexahydrate; 10mM HEPES; 10mM glucose; 5mM potassium chloride. pH 7.4) to cause membrane depolarisation in those cells where channel block has not been effected (final sodium

concentration = 72.5mM). Membrane depolarisation is registered by an increase in fluorescence emission at 565nm.

The change in fluorescence seen in each test well upon the addition of sodium containing buffer is calculated relative to the baseline fluorescence for that well.

5 This figure is then used for calculating the  $IC_{50}$  for each test compound. The results are set out in Tables 1 and 2 below.
